

To provide guests with a DNS (they will not be able to reach the Omnia itself after following the [openWRT \(LuCi\) recipe for making a guest WiFi network](#)):

1. Log in to LuCi
2. Navigate to: `Network > Interfaces`
3. Click: `[edit]` (for the guest network)
4. Scroll down to: `DHCP Server` (section)
5. Click: `Advanced Settings` (tab-hyperlink)
6. Fill out: `DHCP-Options` to be: `6,192.168.2.1`

NOTE: The 6 (in step 5) has something to do the data-length of the DHCP option (for more info refer to [networksorcery.com](#)).
